

Role of Scope 3 and 4 emissions in decarbonization and compliance

Brainstorm session

Agenda

Meeting is under Chatham House Rules

Date: 7 December 2020

Time: 15:00 -16:30

Location: Zoom Webinar

The increasing ambitions towards net zero stipulated by the Paris Agreement, the EGD and via voluntary targets from companies, implies that accounting and complying for indirect emissions will play an ever-increasing role in achieving these pledges.

From the regulatory standpoint, the EU compliance obligations have largely focused on Scope 1 emissions, with the main policy instrument to drive decarbonization being the EU ETS. A holistic view on how Scope 3 (and 4) emissions are addressed and accounted for has been lacking. While there are voluntary Scope 3 GHG reporting methods and initiatives, there are very few mandatory compliance systems in place.

The question is therefore how to treat Scope 3 and 4 emissions in the drive towards decarbonization. Different approaches are conceivable, and these may depend of the time frame considered.

This meeting brings together a small group of stakeholders to discuss the future role of Scope 3 and 4 emissions in decarbonization and compliance obligations. The meeting will start with a presentation by ERCST, outlining some of the approaches that one can imagine addressing Scope 3 and 4 emissions.

This will be followed by two presentations from stakeholders, after which ERCST will moderate a discussion with other attendees.
